The chemical mismatch defines what to investigate next

PuuA is a lead. Can it accept both target substrates?

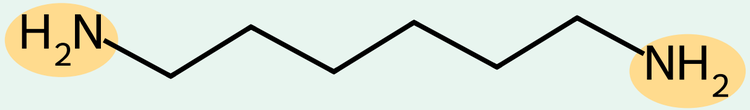

NITROGEN DONOR

Native

Putrescine

Target

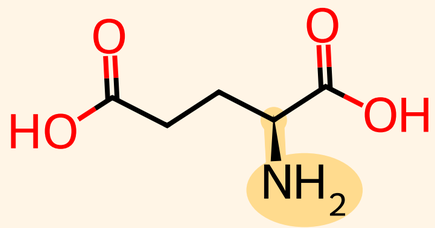

HMDA: longer by two carbons

Can the amine site accept the longer chain?

CARBOXYLATE DONOR

Native

L-glutamic acid

Target

Adipic acid: different donor chemistry

Can PuuA recognize and activate adipate?

PROPOSED NEXT STEP · Evaluate the actual adipate–HMDA pair

PuuA native substrates: Kurihara et al., JBC 2008, PMID 18495664. Neutral identity drawings; target activity is unestablished.
